Empathize & Discover

Date	30 July 2026
Student Name	MD. Adil Shariff
Project Name	Intergalactic Space Travel Request (ISTR) System
Maximum Marks	4 Marks

Empathy Map Canvas:

Empathy Map Analysis

The Empathy Map Canvas was created to gain a deeper understanding of the Mission Requester's needs, expectations, challenges, and experiences during the mission request process. By analysing the user's perspective, it becomes easier to identify the problems encountered in the existing system and design a solution that effectively addresses those issues.

The analysis revealed that mission requesters expect a fast, transparent, and centralized platform where they can submit mission requests, monitor approval progress, and receive timely notifications. However, the existing process relies heavily on manual approvals, repeated follow-ups, and communication between multiple departments, resulting in delays and limited visibility into the request status.

The empathy mapping exercise also highlighted the emotional impact on users. Delayed approvals, lack of real-time tracking, and fragmented communication create uncertainty and frustration, making it difficult for users to plan missions efficiently. Understanding these pain points helped define the key functional requirements of the proposed system.

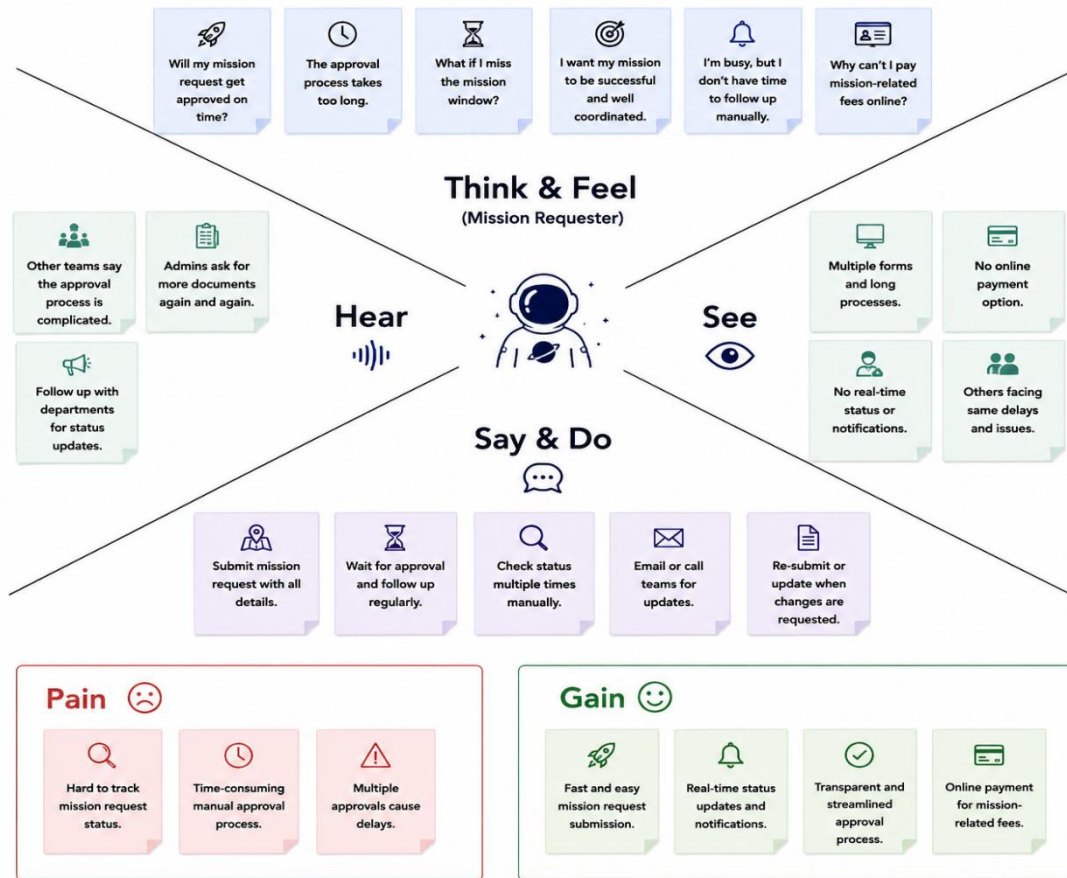

Based on these insights, the **Intergalactic Space Travel Request (ISTR)** system was designed using the ServiceNow platform to automate the complete mission request lifecycle. The solution provides centralized request management, workflow-based approvals, role-based access control, automated notifications, dashboards, and real-time status tracking. These features directly address the identified user challenges and significantly improve the overall mission request experience.

Key Findings

- Mission requesters require a centralized and easy-to-use request submission process.
- Real-time tracking and automated notifications improve transparency.
- Workflow automation reduces approval delays and manual intervention.
- Role-based access enhances security and ensures controlled access to mission data.
- Dashboards and reports provide better visibility into mission progress.

- The proposed ISTR system improves operational efficiency, user satisfaction, and decision-making throughout the mission approval lifecycle.

Example: User Persona , Mission Requester
