OVERVIEW

Intergalactic Space Travel Request (ISTR) is an enterprise-grade workflow automation application built on the ServiceNow App Engine platform. It replaces manual, ad-hoc approval processes with a centralized digital workflow for handling intergalactic mission requests.

Astronauts, scientists, research officers, and mission personnel submit requests through a Service Catalog interface, capturing mission name, destination planet, mission type, schedule, budget, risk level, crew details, and supporting documentation. Each request is stored in a custom table and routed through a structured, multi-level approval chain built in Flow Designer.

KEY CAPABILITIES

Dynamic Form Behavior

Client Scripts and UI Policies adapt the form in real time — e.g. selecting "Alien Negotiation" automatically requires a Diplomatic Officer field.

Backend Automation

Business Rules manage record initialization, state transitions, approval handling, and workflow synchronization.

Role-Based Access Control

Access Control Lists ensure only authorized roles can create, view, modify, or approve mission requests.

Automated Notifications

Stakeholders are emailed automatically on submission, approval, rejection, and status changes.

Mission Analytics Dashboard

Real-time reporting on mission status, approval progress, risk distribution, and destination trends.

Low-Code, Native Build

Built entirely with native ServiceNow tools — no external backend services required.
